Convert the following algorithm into a program and find its time complexity using the counter method.

```
void function (int n)
{
    int i= 1;

    int s =1;

    while(s <= n)
    {
         i++;
         s += i;
     }
}
```

Note: No need of counter increment for declarations and scanf() and count variable printf() statements.

Input:

A positive Integer n

Output:

Print the value of the counter variable

For example:

Input	Result
9	12

Answer: (penalty regime: 0 %)

Answer: (penalty regime: 0 %)

```c
#include <stdio.h>

int main() {
    int n;
    int count = 0;

    scanf("%d", &n);

    // if(n == 1) condition check
    count++;

    if (n == 1) {
        // printf("*");
        count++;
    } else {
        // for(int i = 1; i <= n; i++)
        for (int i = 1; count++, i <= n; i++) {
            // for(int j = 1; j <= n; j++)
            for (int j = 1; count++, j <= n; j++) {
                // printf("*");
                count++;

                // printf("*");
                count++;

                // break statement execution
                count++;
                break;
            }
        }
    }

    printf("%d", count);

    return 0;
}
```

	Input	Expected	Got	
✔	2	12	12	✔
✔	1000	5002	5002	✔
✔	143	717	717	✔

Passed all tests! ✔
